

## ABSTRACT

An identity credence and a method for producing the same are provided in the present invention. In order to produce the identity credence,  
5 the issuing organ firstly constructs a first information packet which comprises identity information and biometrics information; then selects an asymmetric encryption algorithm for digital ciphering on the first information packet with a private key to generate a second information packet; and finally stores the second information packet generated by  
10 ciphering into a medium to produce an identity credence.

FIG. 20 is a schematic diagram of the system.
